

Abstract

The present invention concerns an information processing apparatus, a method thereof, and a program for allowing the audience to easily search for intended television programs. A server stores characteristic words extracted from television program information in a characteristic word file 103. The server also stores the extracted characteristic words associated with IDs for identifying television programs in an association file 102. When the audience selects a characteristic word as an interested word from the characteristic word file 103, the server reads the ID of a television program corresponding to the selected characteristic word from the association file 102. The server reads television program information corresponding to the read ID from a television program information file 101. The server then provides the read television program information to the audience. The present invention can be applied to a recording/reproducing apparatus and a television receiver to provide intended television programs.
